

3 Choose a policy that protects a baseline

Safety has the same probability guarantee as reward coverage. Curve: one exactly solved example.

What does the guarantee mean?

If the set covers the actual reward,
the policy is no worse than a chosen baseline.

Why not make the set very large?

More possible rewards make improvement harder.

At $R \geq 1$, this ball can certify no gain.

$R < 1$ allows a gain, but does not guarantee one.
